Axcess1 AI 3.0: a new era in intelligent redaction.

Canadian innovation. Sovereign artificial intelligence. Unprecedented control.

Introducing Axcess1 AI, Canada's next generation of sovereign AI redaction technology, inside a complete access-to-information and privacy platform. The AI does the work. Your officers make every decision.

hosted here or on your servers

100% Canadian-developed · **Client documents processed in Canada** · **Bilingual EN/FR** · **Federal, provincial and municipal Acts**

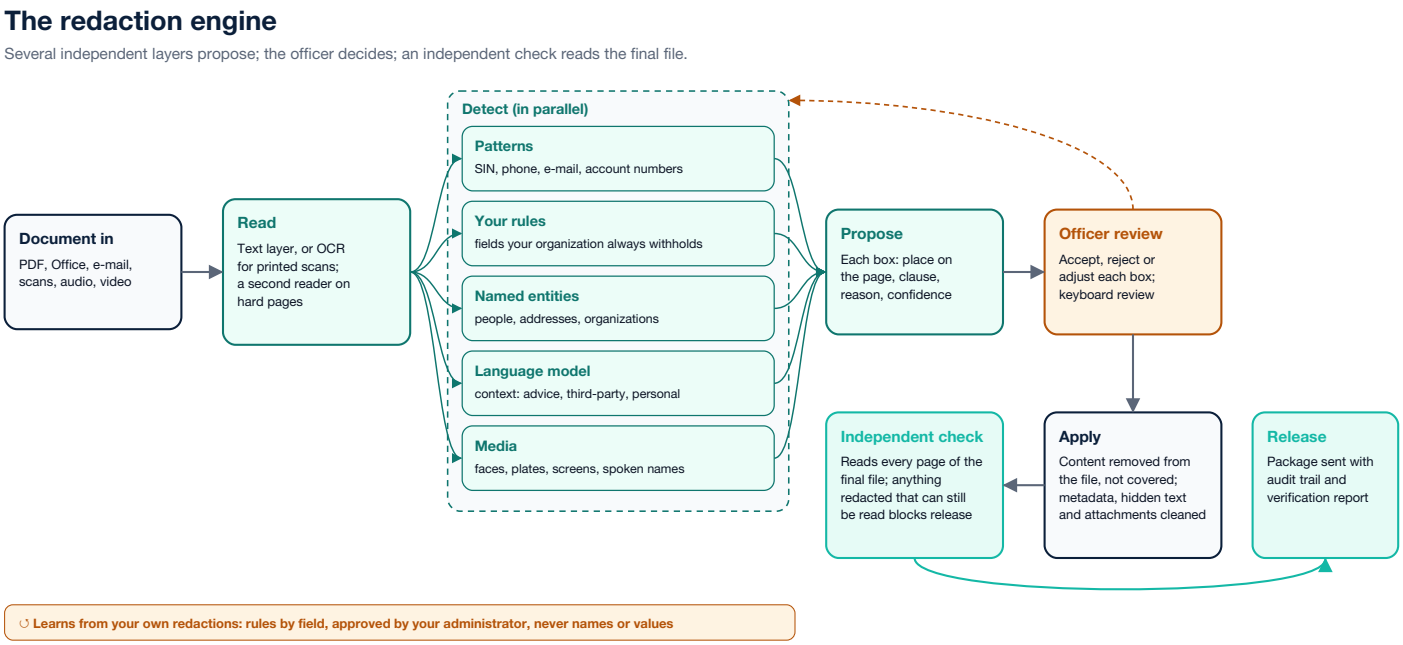

INSIDE

1. The redaction engine
2. The workflow, from intake to release
3. Sovereign infrastructure in Canada
4. Consortiums: share the AI power, share the cost
5. Security, tests and how to start

LAYER BY LAYER

The redaction engine

Axcess1 does not ask one model to guess. Several layers each do what they do best, and every result is checked before anything leaves.

How a page becomes a verified release copy

Read every page

- Text layer when the document has one; intelligent OCR for printed and scanned pages, tables and forms, in English and French.
- A second reader re-reads hard pages, and areas it cannot read with confidence are shown to the officer.

Find what must be protected

- Patterns (phone numbers, SIN, e-mails, account numbers), rules by field learned from your own redaction, named-entity recognition and a language model, working together.
- Each proposal carries its confidence, its reasoning and the clause of your Act.

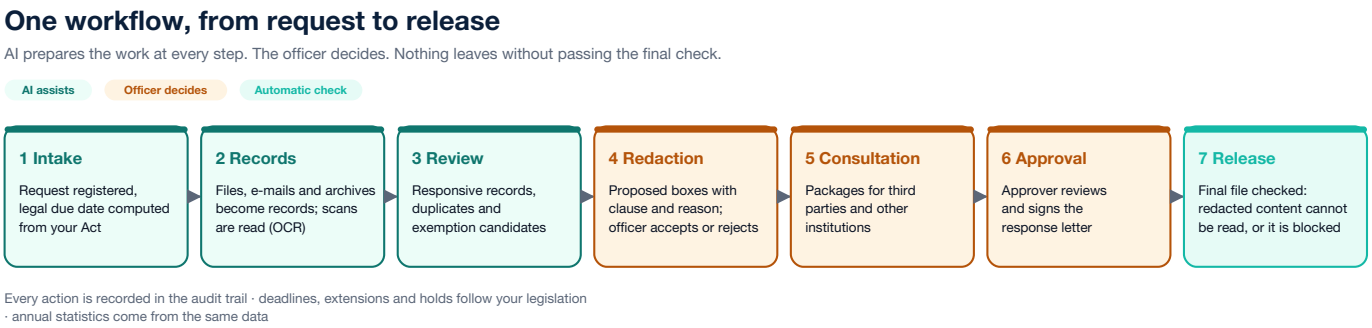

Redact for good

- Accepted boxes are burned into the page image: the text under them is gone, not hidden.
- The file is rebuilt without metadata, hidden text, scripts or attachments, then an independent verifier reads every page and blocks the release if anything that was redacted can still be read.

AI PROPOSES · THE OFFICER DECIDES

The workflow, from intake to release

Every step of the access request lives in one platform: deadlines, correspondence, consultations, approvals and the audit trail. The AI helps at each step; it never decides.

One request, end to end

Intake and triage

- Requests registered with the right Act, deadline and officer; records uploaded in any common format, including e-mails and ZIP files, each item accounted for.

Analysis and review

- Batch analysis of whole requests, responsiveness and duplicate detection, AI suggestions reviewed one by one, by mouse or keyboard.

Approval and release

- Coordinator review, consultations, the release package and the cover letter, then the verification gate and an audited release.

Nothing is redacted, released or sent until a person decides it. Every decision, by a person or proposed by the AI, is recorded.

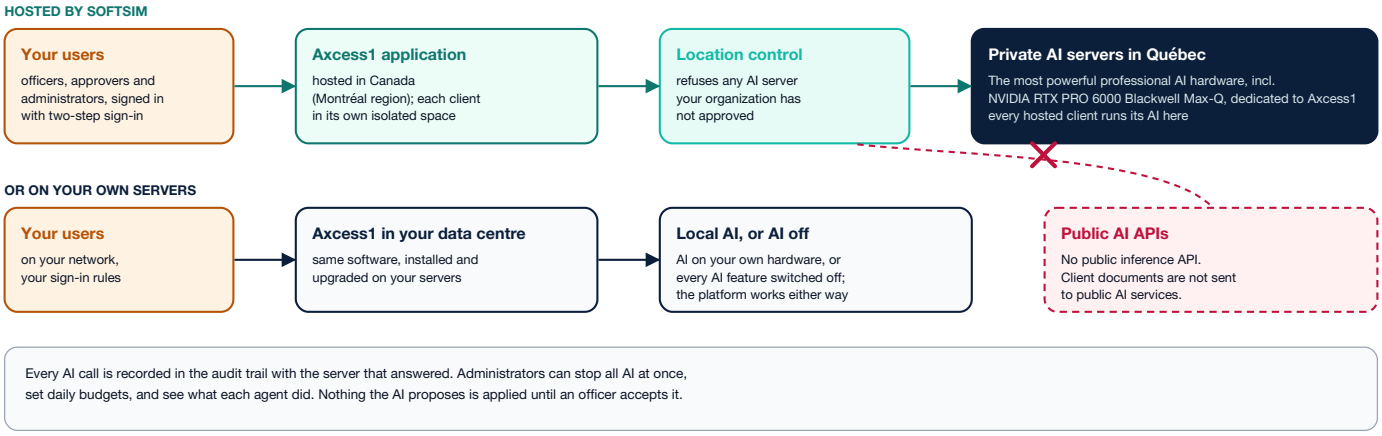

YOUR AI, IN CANADA

Sovereign infrastructure in Canada

Every client we host runs its AI on our own servers in Canada, on the latest, most powerful professional AI hardware, including NVIDIA RTX PRO 6000 Blackwell Max-Q, dedicated to Axcess1, with no public AI service involved.

Where your documents go, and where they never go

Hosted or on your own servers, client documents are processed only by AI servers your organization approves.

Where your documents go, and where they never go

Private by design

- No public inference API: client documents are processed only by the AI server the organization approves.
- A location control in the application refuses any other AI server.
- Open-weight models on our own hardware: no per-token API fees, no surprise AI bills.

Deployed your way

- Hosted by SoftSim in Canada, in our private infrastructure.
- On your own servers, with local AI where your hardware allows, or with AI switched off.

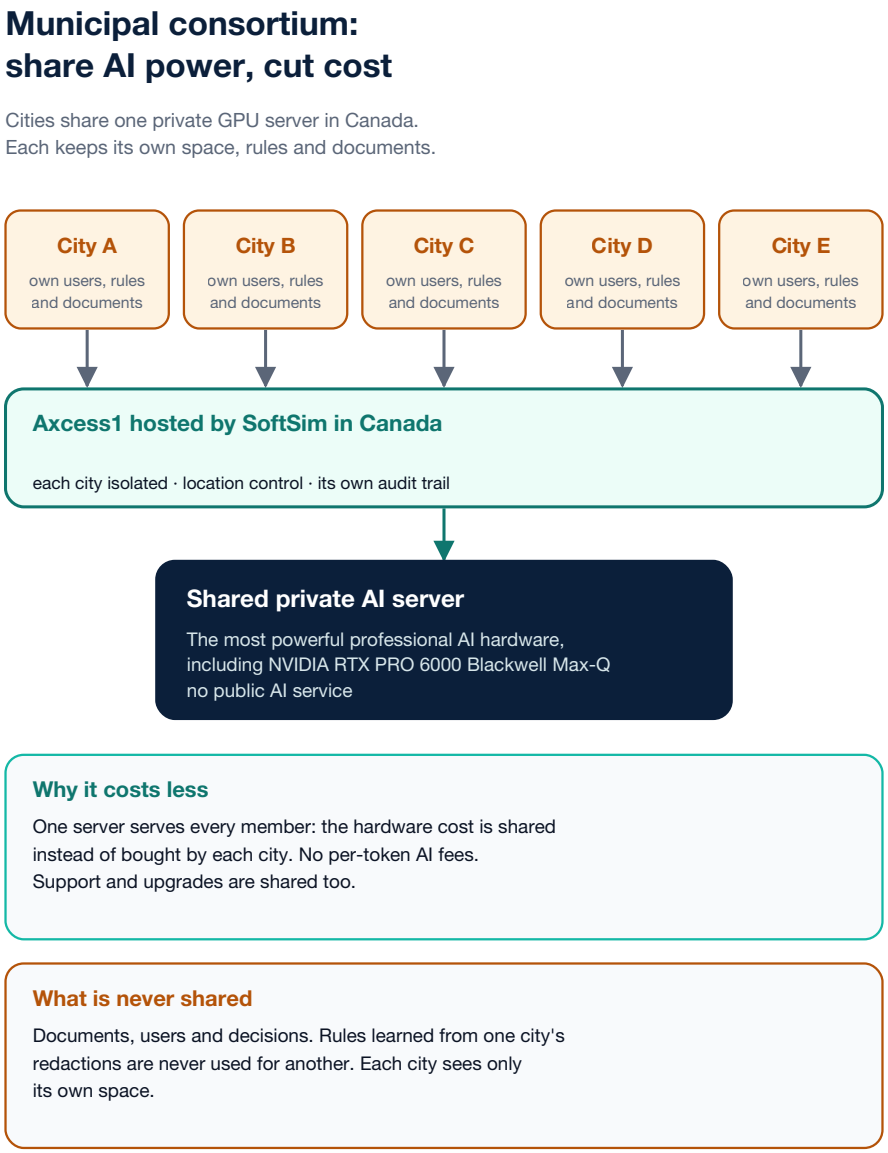

Adapted to you in two weeks

The AI models arrive fully trained. Before go-live, we spend two weeks adapting them to each organization: the AI learns your forms and your redaction practice from your own redacted records (as rules by field, never the names or values in them), your administrator approves every rule, and we measure accuracy on your documents. Nothing learned from one organization is used for another.

TOGETHER, EACH ONE ISOLATED

Consortiums: share the AI power, share the cost

A GPU server of this class is a serious investment for one organization. Shared in a consortium, every member gets the same AI power for a fraction of the cost, without sharing a single record.

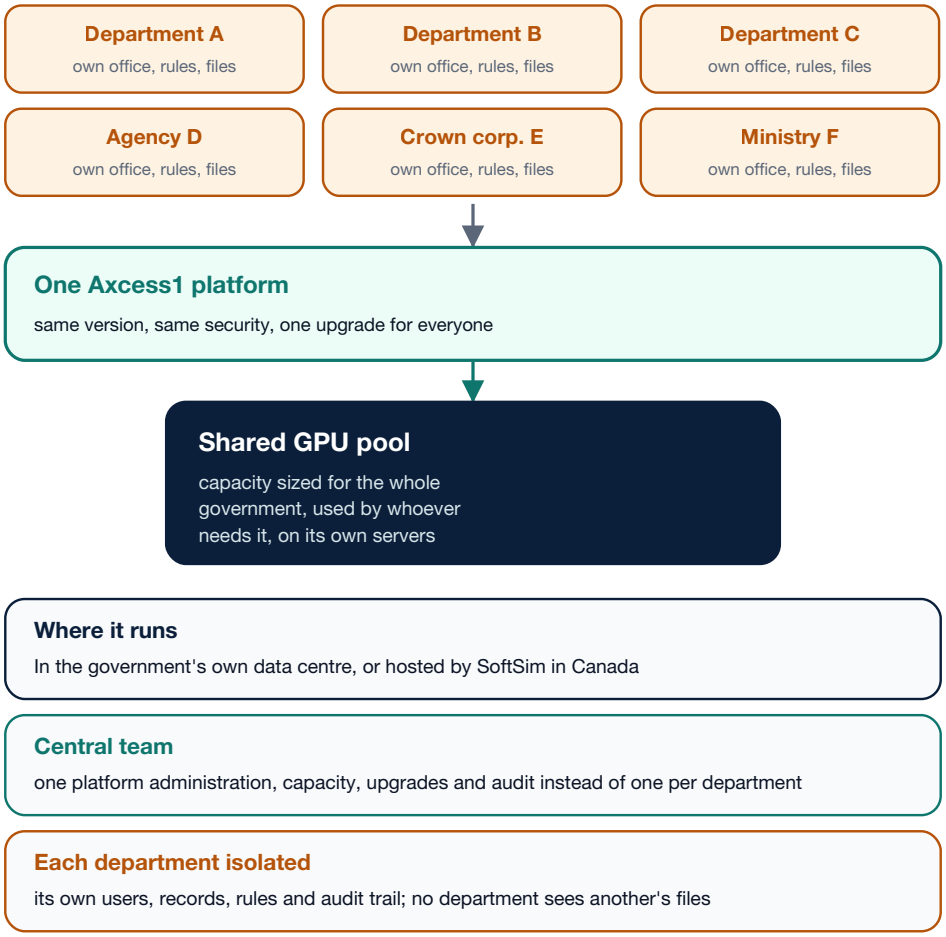

- Several cities share one private GPU server in Canada.
- Each city has its own isolated space: its own users, records, redaction rules and administrator.
- The capacity is shared fairly: a large batch from one city never blocks the others.
- Hardware and operation are shared, so each member pays a share of one server instead of a whole one.

TOGETHER, EACH ONE ISOLATED

Departments of one government

Government consortium: departments share the IT power

One platform and one GPU pool for many departments, run by the government or hosted by SoftSim in Canada.

- The departments of a government share the GPU capacity and the platform.
- Each department stays isolated, with its own requests, rules, approvals and audit trail.
- Central capacity and oversight, with AI volume measured per department.
- One investment serves many access offices, with no public AI service anywhere.

We set up consortiums with you: members, capacity, governance and how the cost is shared.

SECURITY · TESTS · NEXT STEP

Security you can document. Tested every release.

Clearances

- SoftSim holds a Top Secret Facility Security Clearance and Document Safeguarding Capability up to Protected B (PSPC).
- SoftSim is registered in the Controlled Goods Program.
- Axcess1 is designed for the Protected B baseline.

Controls

- Isolation of every organization, two-step sign-in, account lockout, strong passwords, 8-hour sessions, complete audit trail.
- AI controls: emergency stop, daily budgets, human approval of every action, an audit record of every AI run.

Tests

- More than 2,600 automated tests on every change.
- 110 end-to-end scenarios run on the live service after every deployment.
- Every client release rehearsed as an upgrade of a real installation before it ships.

Try it on your own documents.

A personalized demonstration, your deployment options, or a confidential pilot on your own documents.
